

1. INTRODUCTION

1.1 OVERVIEW:

An airplane crash analysis is a detailed investigation into the causes of an aviation accident. The goal of an airplane crash analysis is to identify any factors that contributed to the accident, with the ultimate goal of improving safety and preventing future accidents. The process of conducting an airplane crash analysis typically involves the collection and analysis of a wide range of data, including information about the aircraft and its systems, the operators, and any other relevant factors.

This data is typically collected from Kaggle. Once the data has been collected, it is analysed through tableau, to identify any potential causes of the accident. The results of an airplane crash analysis are typically published in a report, which may include recommendations for improving safety and preventing similar accidents in the future. These recommendations may be implemented by the relevant authorities or industry organizations.

1.2 PURPOSE

To effectively discover the hazards that led to the accident and to prevent their recurrence in a future accident or incident. In the course of that investigation, additional hazards which increased damage and injury (inadequate crashworthy systems, system safeguards, rescue team response, etc.

2.1 EMPATHY MAP

Empathy map

Use this framework to develop a deep, shared understanding and empathy for other people. An empathy map helps describe the aspects of a user's experience, needs and pain points, to quickly understand your users' experience and mindset.

Build empathy

The information you add here should be representative of the observations and research you've done about your users.

Says

What have we heard them say?
What can we imagine them saying?

Thinks

What are their wants, needs, hopes and dreams? What other thoughts might influence their behavior?

Does

What behaviors have we observed?
What can we imagine them doing?

Feels

How are they being, functioning, and motivated? What other feelings might influence their behavior?

Need some inspiration?

2.2 IDEATION & BRAINSTORMING MAP

Brainstorm & idea prioritization

Use this template in your work

Brainstorming, asking for your team's input, and shaping the ideas into a plan that you can act on.

1. Before you collaborate

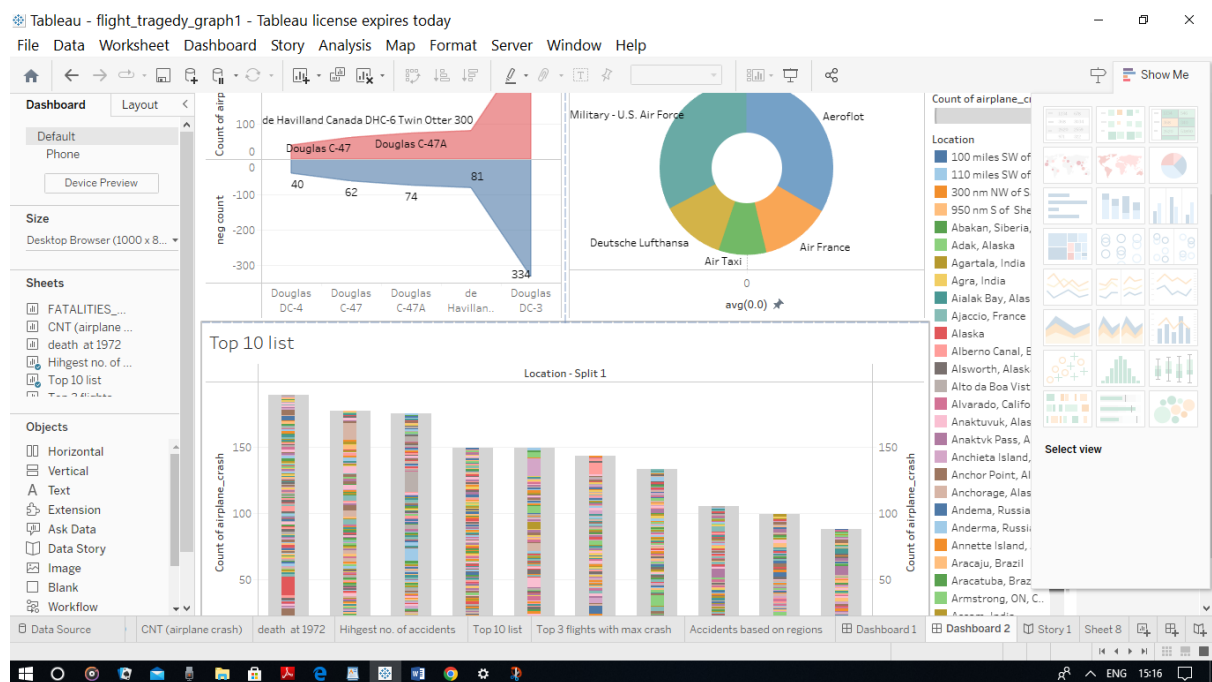

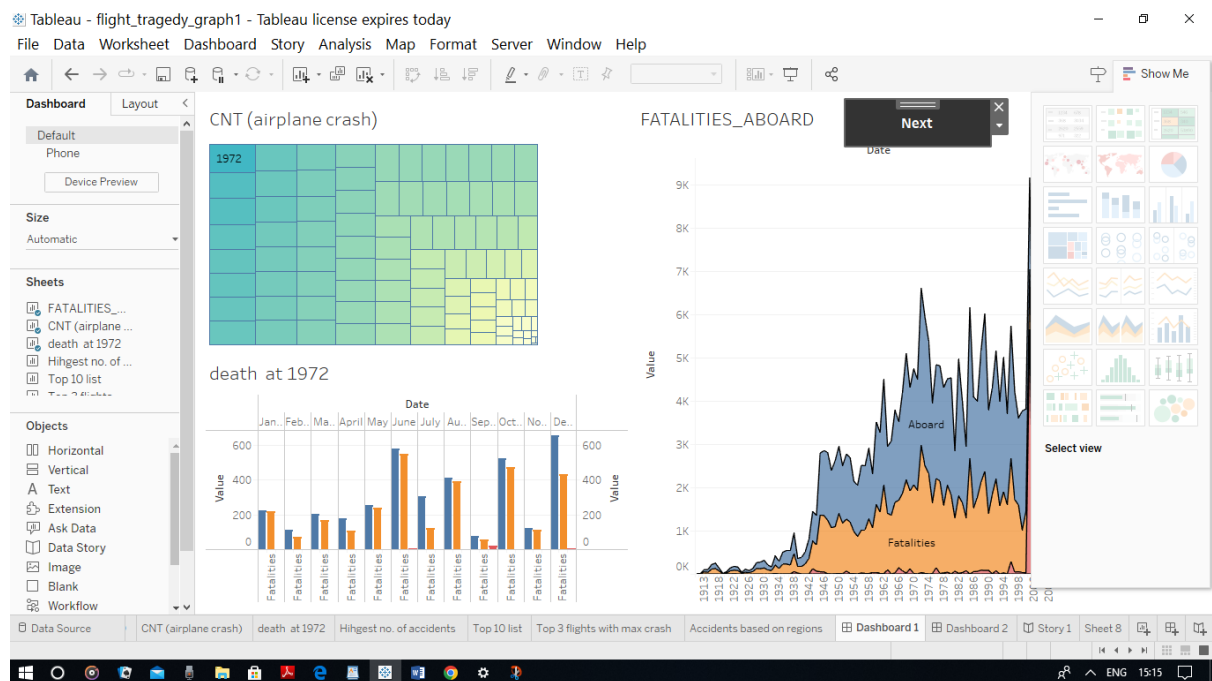

2. Define your problem statement

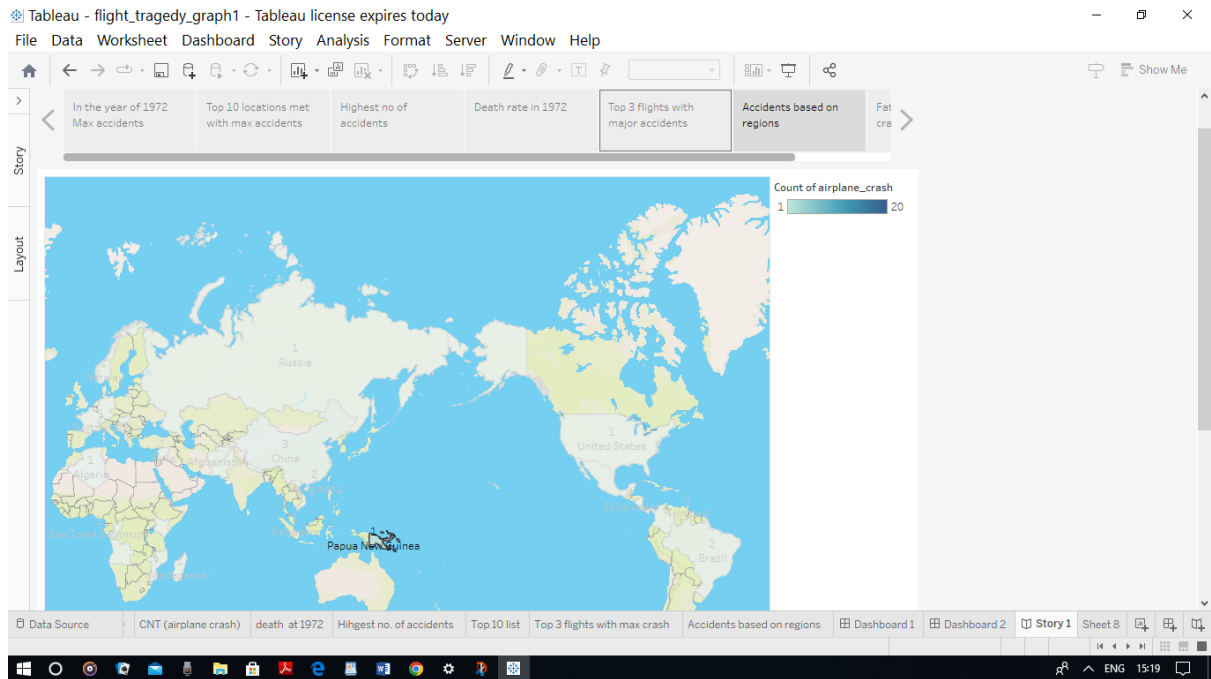

3. Brainstorm

4. Group ideas

5. Prioritize

3. RESULT

4. ADVANTAGE AND DISADVANTAGE

ADVANTAGE

Speed

One of the best advantages of airplanes, is that when you need to get somewhere fast, flying is often the best option. It can get you across the country or around the world in a matter of hours. If you have a choice between flying and driving, flying will almost always get you there faster.

Comfort

With wider seats, more legroom, and in-flight entertainment, flying can be a very comfortable experience. On international flights anyway! When you compare it to other forms of transportation like buses or trains, it's often much more pleasant.

Efficiency

One of the key advantages of air transport, is that planes are designed to get you from Point A to Point B as quickly and efficiently as possible. They can cover large distances in a relatively short amount of time. Even when you factor in the time it takes to get to and from the airport, flying is often just as quick but usually quicker as other forms of travel including high speed trains.

DISADVANTAGE

Cost

One of the biggest disadvantages of flying is the cost. It can be very expensive to purchase a plane ticket, especially if you're flying internationally. Sure, budget airlines might offer some cheap flights, but they often come with their own set of problems (more on that below).

Time Commitment

Flying can take a lot of time, especially if you're flying to a far-flung destination. You have to factor in travel time to and from the airport, as well as time spent waiting at the airport itself.

Hassle

Even for hardened travelers, flying can be a hassle, especially if you're dealing with delays, cancellations, or lost baggage. It can be frustrating to deal with the logistics of air travel, and it's not always a smooth or easy process

5. APPLICATION

Investigating Airplane Crash Data with Watson Analytics and Cognos Analytics is a big data project that involves discovering and examining airplane crash patterns using IBM's Watson Analytics and Cognos Analytics. This project aims to: (1) find some factors that contribute to crashes, (2) analyze patterns of the data collected from all over the world in the past decades, and (3) find replicable solutions for both aviation industry and customers. This paper looks for correlations between crashes and different variables and predicts when crashes are most likely to happen in a year.

The analysis of over 73,000 data points, collected from a subsidiary of Google LLC Kaggle, displays a decrease in the number of airplane crashes and fatalities over the years, an increase in the number of passengers, predictive values for the future years, correlations between different variables, and strong correlations between the occurrence of crashes and the following time variable: yearly, monthly, and daily.

6. CONCLUSION

In this study, the classification is performed by four different kinds of classification algorithm. The dataset is tested on all the four types of classification algorithms and the patterns of every algorithm are evaluated. The performance of the entire system is essential which mainly depends on the accuracy of results. Accuracy of the XGBoost algorithm is the highest and hence, it is the algorithm selected mainly for the datasets belonging to the aviation industry. The paper has focused on the importance of feature selection and how the relevant features affect the accuracy of the prediction. All the redundant data from the dataset are eliminated. Hence, we extract the key attributes that will highly influence the result of the data and sort them in accordance to their ranking. The prediction is helpful for the company and the pilot to take all the necessary steps to avoid airplane crash. Hence, the classification algorithms have a major role in the data analysis and prediction.

7. FUTURE SCOPE

The system is able to predict whether the airplane will be be "safe" or not. As a result, the delays of every airplane can also be predicted. The period after which an airplane has to go under the maintenance stage can also be included with the system. Hence, the system will be the one stop destination to check the flight delays, airplane crashes and the period after which the flight should undergo the maintenance phase.
